

## Which Infants and Toddlers Might Qualify for the National Deaf-Blind Child Count?

Any infant or toddler who is suspected of having both a vision and hearing loss may qualify for services provided at NO COST to early intervention teams.

This includes infants and toddlers who are at risk for having a combined vision and hearing loss due to:

- A hereditary syndrome or disorder, such as CHARGE Association or CHARGE syndrome, Down syndrome, Trisomy 13, Usher syndrome, Goldenhar syndrome
- Pre and post-natal conditions, such as Fetal Alcohol syndrome, congenital
  infections (syphilis, rubella, CMV, toxoplasmosis, herpes, AIDS/HIV), IVH (brain
  bleed), PVL (periventricular leukomalacia), hydrocephalus, microcephaly,
  meningitis, encephalitis, asphyxia
- Severe head injury and/or direct trauma to the eye and ear
- Premature birth
- Family history of both vision and hearing loss
- Multiple disabilities

It also includes infants and toddlers with a documented or suspected vision or hearing loss who demonstrate behaviors that might indicate a combined sensory loss. Some of these behaviors include:

- Balance problems, bumping into or tripping over objects
- Inconsistent responses to sounds or visual images
- Light gazing
- Tactile sensitivity
- Overactive startle response
- Communication by biting, hitting self or others, throwing objects, screaming, etc.
